# AEM TASK -4

News Page Component Implementation

Creating News Page Component:

News Page Component is created using the **Base Page Component** to maintain a consistency in structure and functionality across different pages.

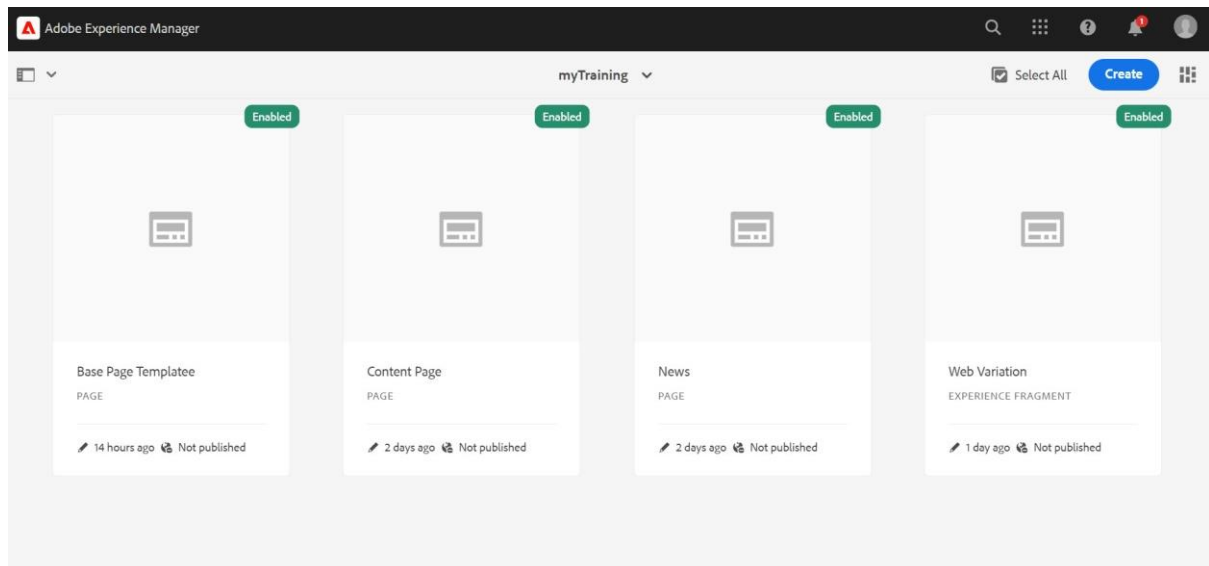

Custom Page Property:

A custom page property called **About** is created. This allows content authors to set a **default news image** that will be displayed when no specific image is provided for a news article.

Creating News Template Type:

A **News Template Type** is created using the **News Page Component** to standardize the layout and behavior of news pages.

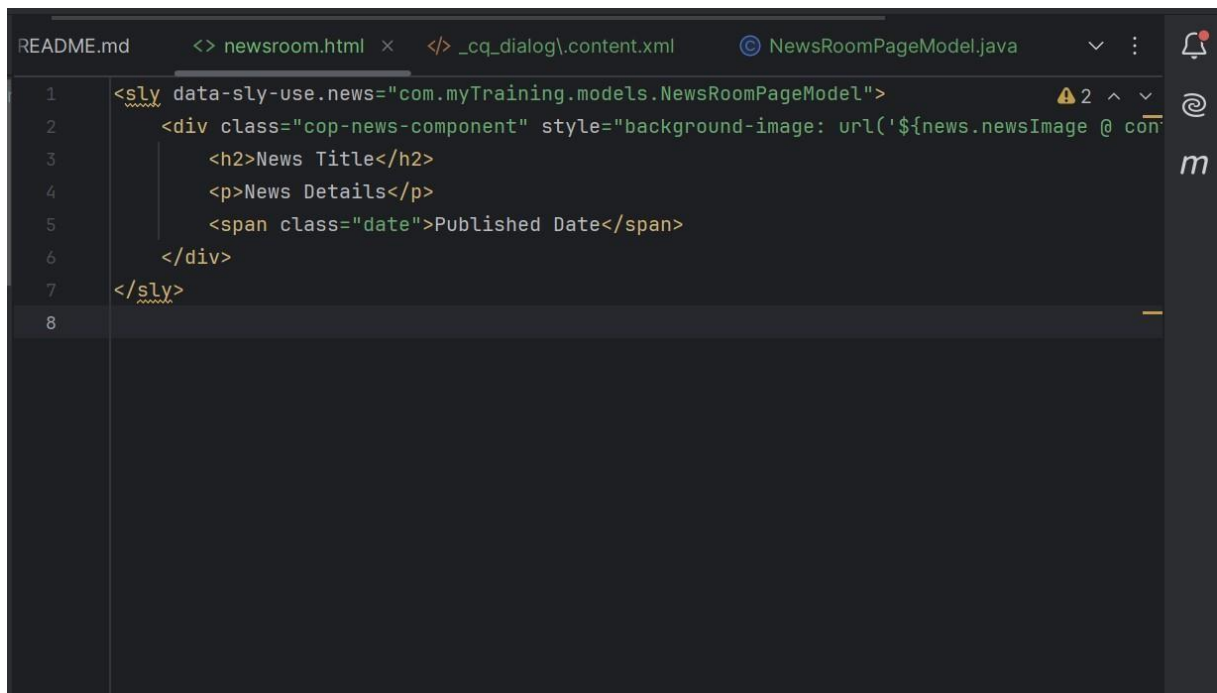

Applying Styling from ui.frontend Folder:

The styling for the **News Component** and **Hello World Component** is applied from the **ui.frontend folder** to maintain consistency and a professional look.

```css
.cmp-helloworld {
    background-color: lightblue;
    padding: 15px;
    border-radius: 5px;

    h2 {
        color: blue;
    }

    p {
        color: darkgray;
    }
}
```

Creating Custom Style for News Component:

A **custom style** is created to allow authors to apply specific styling to the **Hello World** and **News Component**, ensuring a consistent visual presentation.
